7.....	Create a virtual service to provide a RESTful interface for placing messages	16
8.....	Logging	17

Chapter 1 | Introduction

This document describes how to perform the following tasks in SOA Software Policy Manager.

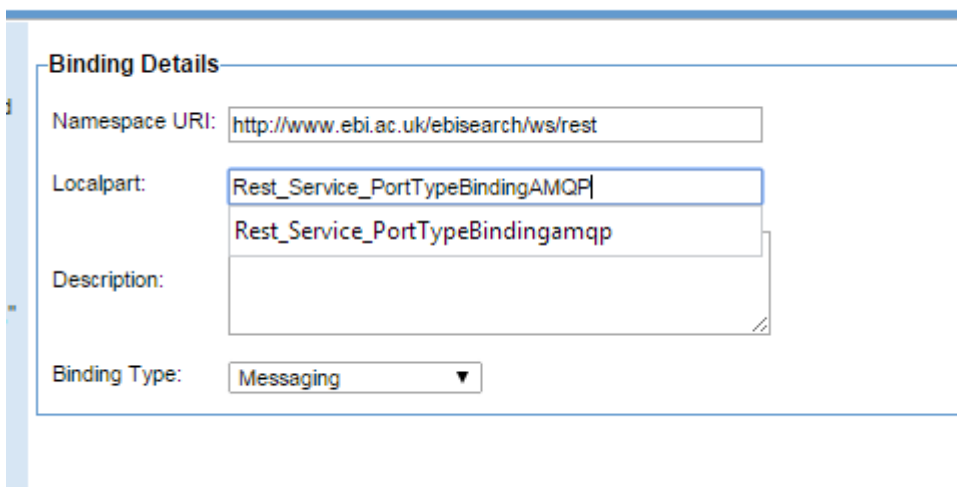

- Create AMQP binding for services of any type (REST, Messaging, SOAP).
- Create a virtual service that provides a messaging (AMQP or JMS) interface to one or more existing services of any type (REST, Messaging, SOAP).
- Create a virtual service that provides a RESTful interface for placing messages onto, and pulling messages from a JMS or AMQP queue.

Chapter 2 | Add Messaging Binding (AMQP or JMS)

- 1 Launch the *Policy Manager Management Console*.
- 2 Select **Create Physical Service**, create a physical service with http://www.ebi.ac.uk/ebisearch/ws/rest?_wadl
- 3 Navigate to *Configure > Registry > Bindings* and select **Add Binding**.
- 4 Select the service added in Step 2.

- 5 On the next screen, select the Messaging Binding type.

- 6 In next screen, select AMQP as the Transport protocol.
- 7 Provide Destination and Reply To fields with desired I/O/Fault Serializations.
- 8 Select Part type in *Parts* section. This sections is used to assign Path parameters, Query parameters, Body parameters (e.g., <http://agubba-e6420:9901/VS/{domainid}/entry/{entryids}?fields=<fields>&fieldurl=<fieldurl>&viewurl=<viewurl>&format=<format>>) is the URL to hit. In that case, the Binding screen configuration should be something like

Operation: GET ____domainid__entry__entryids_

Destination Type:

Destination Name:

Input Content Type:

Output Content Type:

Fault Content Type:

Reply To:

Parts

Part	Name	Type	Value
fieldurl	fieldurl	Property ▼	true
entryids	entryids	Property ▼	WAP_RAT,WAP_MOUSE
viewurl	viewurl	Property ▼	true
domainid	domainid	Property ▼	uniprot
format	format	Property ▼	json
fields	fields	Property ▼	descAltName,organism_scientific_name

So that the request will hit, http://agubba-e6420:9901/VS/uniprot/entry/WAP_RAT,WAP_MOUSE?fields=descAltName,organism_scientific_name&fieldurl=true&viewurl=true&format=json

- 9 Provide an XPath or SQL query for Use selector option (e.g., Operation='get').
- 10 After adding the required fields, finish the process.
- 11 Similarly, select JMS in Transport field, if it is desired to have a Messaging Binding over JMS protocol

Chapter 3 | Add AMQP listener

- 1 Select the *Containers* folder where you will be adding the AMQP listener, and select **Add Listener**.
- 2 Select the AMQP Listener type.
- 3 Add an AMQP listener with details as shown below.

Configure AMQP Container Listener

The "Configure AMQP Container Listener" screen allows you to configure an AMQP listener for the current Policy Manager Container. The screen is organized as follows:

Listener Details:

- Listener Name - Specify an instance name for the listener.
- Description - Specify a description of the listener.

AMQP Details:

- Virtual Host Name - This option allows you to specify the virtual host name of the AMQP broker.
- Port - Displays the default port 5672 used for AMQP connections.

Authentication Required:

If the AMQP binding will be used to authenticate an AMQP registry where AMQP destinations or targets are located, or to authenticate the AMQP system itself, authentication may be required. To enable authentication, select the checkbox and specify the username and password credentials.

Connection Properties:

Connection properties are user-defined additional properties that allow you to specify the messaging engine that an application will connect to. Only "String" type message properties are supported. Connection Properties are configured by entering a "Property Name" and "Property Value". You can enter unlimited connection properties. Entering a Connection Property is optional.

Configure the listener properties based on your requirements. After you have completed your

Chapter 4 | Add JMS listener

- 1 Select the *Containers* folder and Network Director (**ND1**) container where you will be adding the JMS listener, and select **Add Listener**.
- 2 Select the JMS listener type.
- 3 Add the JMS listener with details as shown below.

SOA Software Policy Manager - Add Container Listener - Google Chrome

agubba-e6420:9900/faces/container/add_container_listener_select_category.faces

POLICY MANAGER™

Configure JMS Container Listener

The "Configure JMS Container Listener" screen allows you to configure a JMS listener for the current Policy Manager Container. The screen is organized as follows.

Listener Details:

Listener Name - Specify an instance name for the listener.

Description - Specify a description of the listener.

Connection Details:

JNDI URL--A text box that allows you to enter the URL where the Java Naming and Directory Interface (JNDI) server can be accessed.

JNDI Initial--Context A text box that allows you to enter the starting point for resolution of names for naming and directory operations.

JMS Destination Factory Name--A text box that allows you to enter a topic name or queue with a physical resource for the Java Message Service (JMS) Destination Factory.

Connection Properties:

Connection properties are user-defined additional properties that allow you to specify the messaging engine that an application will connect to. Only "String" type message properties are supported. Connection Properties are configured by entering a "Property Name" and "Property Value". You can enter unlimited connection properties. Entering a Connection Property is optional.

Thread Pool:

The "Thread Pool Details" section is used to manage the thread configuration for the estimated

Help < Back Next Finish Cancel

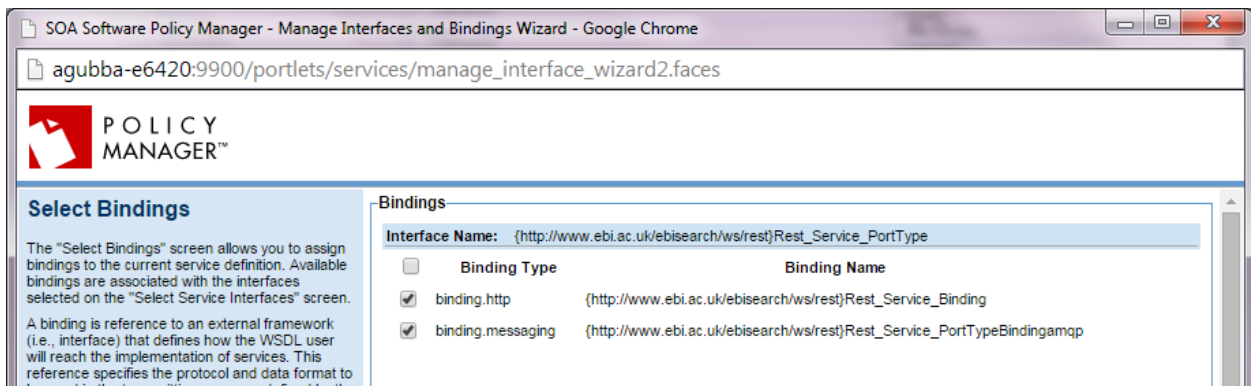

Chapter 5 | Assign Messaging Binding to Service

- 1 Select the Services folder for the Physical Service. In the *Service Overview* section select **Manage** in the *Interfaces and Bindings* section.

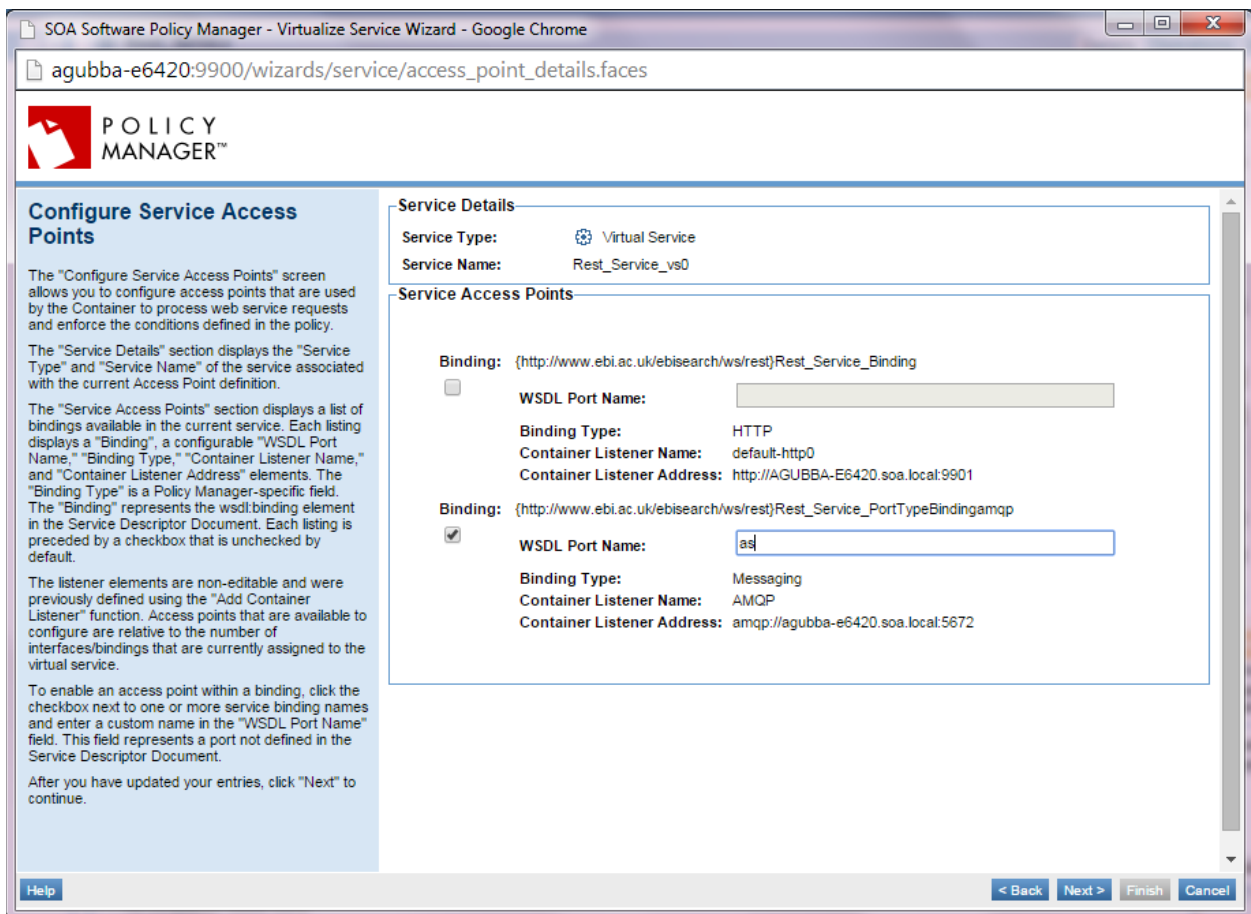

- 2 On the *Select Interfaces* screen, select the Messaging Binding and assign it to the service (i.e., copy to the Interfaces Assigned panel), and complete the wizard.

- 3 Select **Virtualize Service** and virtualize the physical service on the AMQP/JMS listener on Network Director (**ND1**), and assign a service name (e.g., **VS1**).

- 4 The virtual service should be hosted on the **ND1** where we have previously added the AMQP/JMS listeners.

The screenshot displays the SOA Policy Manager web application. The browser address bar shows the URL `agubba-e6420:9900/ms/ms.do?time=1424766912003`. The page header includes the "POLICY MANAGER" logo and a login status message: "(You are logged in as Local Domain/a from Asia/Calcutta tn)". A navigation bar at the top contains tabs for "DASHBOARD", "WORKBENCH", "ALERTS", and "SECURITY". Below this, a "Browse | Search" bar is visible.

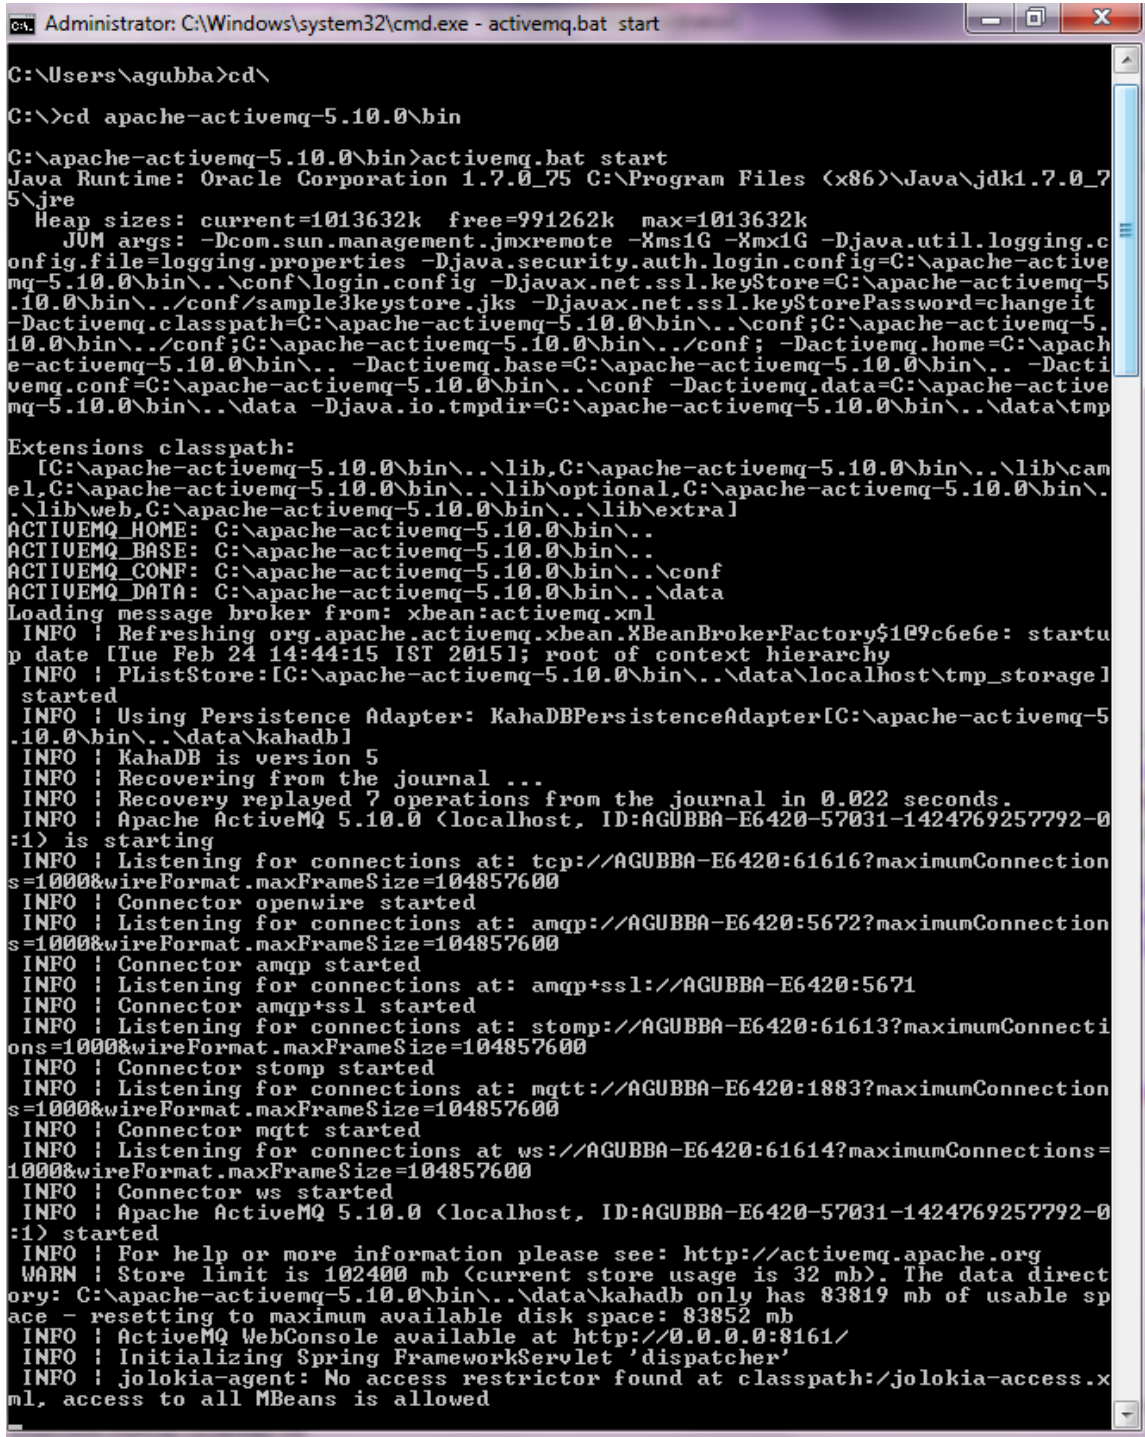

The main content area is divided into two sections. On the left is the "Organization Tree" with a tree view showing the hierarchy: `Registry` > `AMQP` > `Processes` > `Scripts` > `Services` > `Rest_Service` > `Rest_Service_vs0`. On the right, the configuration details for `Rest_Service_vs0` are shown. It includes a table with the following data:

URL	Binding Type	Interface Name	Action
<code>amqp://agubba-e6420.soa.local:5672</code>	Messaging	<code>Rest_Service_PortType</code>	Actic

Below the table, there is a pagination control showing "Page 1 of 1" and a refresh button.

Chapter 6 | Send Requests to API Using ActiveMQ

- 1 Network Directory (**ND1**) must be connected to an AMQP broker such as apache-activemq-5.10.0.
- 2 Run ActiveMQ.

```

Administrator: C:\Windows\system32\cmd.exe - activemq.bat start

C:\Users\agubba>cd\

C:\>cd apache-activemq-5.10.0\bin

C:\apache-activemq-5.10.0\bin>activemq.bat start

```

- 3 Access activeMQ client at 'http://agubba-e6420:8161/admin/'.

- 4 Navigate to the *Queues* tab or *Topics* tab depending on the destination type used during Messaging Binding creation.
- 5 Select the Queue viz., *dynamicQueues/dest5* in this scenario.

Queue Name	0	0	0	0	Active Producers	Send To Purge Delete
dynamicQueue/Rayudu	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueue/Sai	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueue/San	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueue/Ton	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueue/Ton1	1	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueue/vertui	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/01	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest1	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest11	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest13	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest3	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest5	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest6	0	0	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest7	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete
dynamicQueues/dest9	0	2	0	0	Browse Active Consumers Active Producers	Send To Purge Delete

- 6 Click on **SendTo** against the destination name.
- 7 Provide the appropriate Correlation ID, ReplyTo and Message Body and send the request.

Chapter 7 | Create Virtual Service to Provide RESTful Interface for Placing Messages

- 1 Virtualize the above service on Network Director (ND2) with HTTP binding, and assign a name (e.g., **VS2**).
- 2 Send requests to **VS2**.
- 3 The requests will hit the **VS1** > physical service

And the response is seen.

Chapter 8 | Logging

- 1 If the *Detailed Auditing* policy is attached to **VS1** and **VS2**, usage logs will be generated.
- 2 **VS2** logs:

The screenshot shows the SOA Software Policy Manager interface. The left pane displays the Organization Tree with the following structure:

- Registry
 - AMQP
 - Processes
 - Scripts
 - Services
 - Rest_Service
 - Rest_Service_vs0
 - Rest_Service_vs0_vs0

The right pane shows the details for **Rest_Service_vs0_vs0**. The top navigation bar includes: **DASHBOARD**, **WORKBENCH**, **ALERTS**, **SECURITY**, **AUDITING**, and **CONFIG**. Below this is a **Browse | Search** bar. The main content area has tabs for **Details**, **Operations**, **Bindings**, **Access Points**, **Categories**, **Rules**, and **Monitor**. The **Monitor** tab is active, showing a **Logs** view. The **Time Range Filter** section shows a start date of 02/23/2015 and an end date of 02/24/2015, with a period of **Last hour**. The **Content Filter** section includes fields for **User Id**, **Consumer Id**, **Contract Key**, **Client IP**, and **Operation** (set to **All**). The **Transaction Filter** section shows **Errors** set to **Transactions (All)**. A **Search** button is located to the right of the **Transaction Filter**. Below the filters is a table with the following data:

Request Date/Time	Operation	Response Time	Contract Name	Errors
02/24/2015 15:11:52.0	GET /(domainid)/entry/(entryids)	6733 ms	asd	None
02/24/2015 15:10:45.0	GET /(domainid)/entry/(entryids)	63234 ms	asd	None
02/24/2015 15:11:48.0	GET /(domainid)/entry/(entryids)	492 ms	asd	None
